**Storyboard Overview:** Above is what the UI looks like from a birds eye view when viewed in Xcode. This storyboard layout is the view that the UI was designed in and gives you a general idea of the connections each page has to each other. The overall application was designed to have a tab bar controller and we later added in the navigation controller which added gesture navigation.
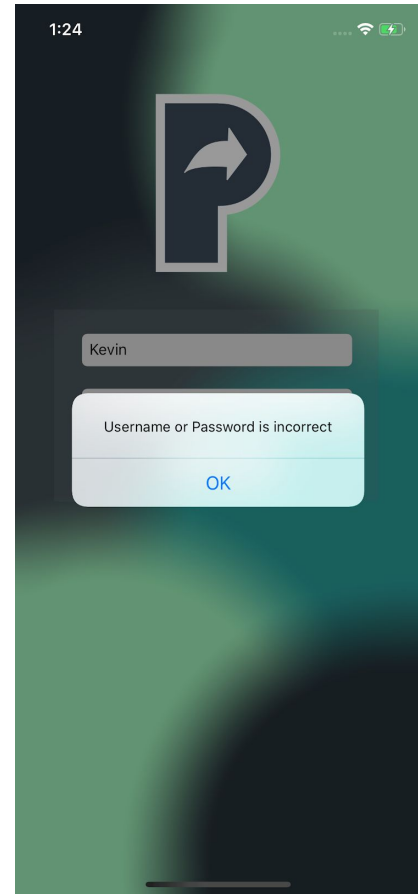

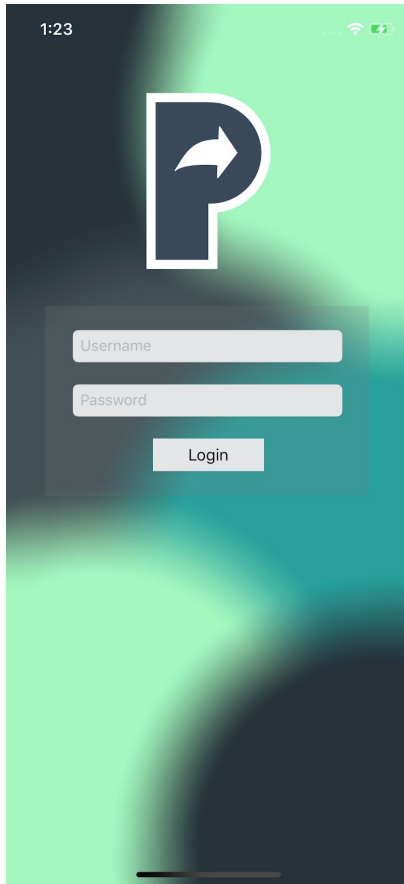

**Login Screen:** You start by seeing our logo that was created to give a pleasing image to look at. The background is our color scheme that we all picked out. We wanted a simplistic way to log into our service. We accomplished this by having two text fields that specify what you are supposed to enter into each. The text fields and login button are contained by a semi transparent box to make everything feel connected.
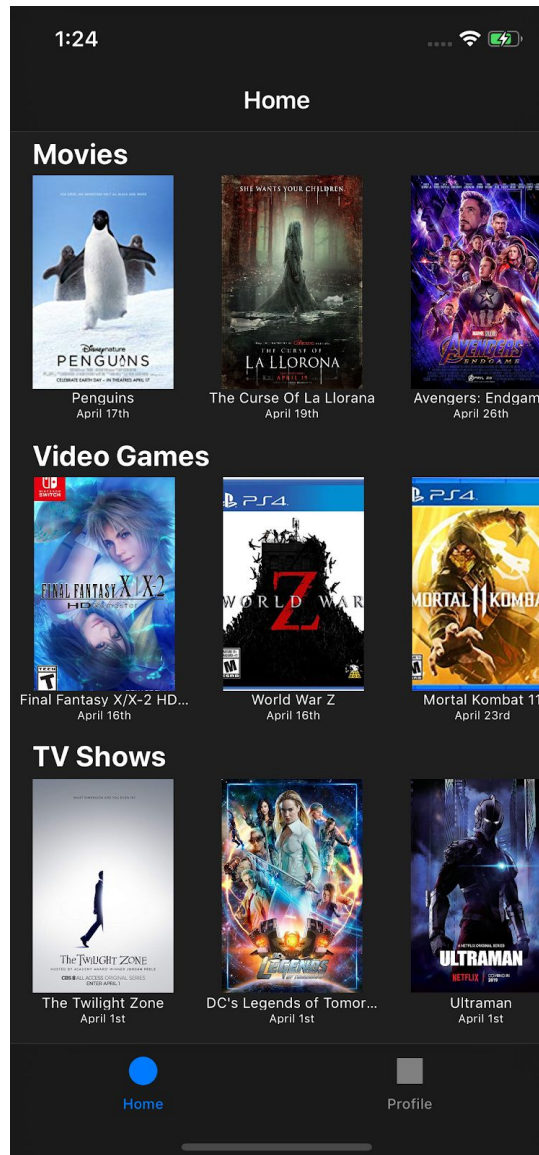

Home Screen: We wanted to create an interface that was intuitive to use while also fitting a good amount of information. There are three separate rows of information which are under the header that tells you what category of information you're looking at. Each piece of information has 3 main pieces of info which is the poster art, title, and release date. Each category you can scroll horizontally which is familiar to most people if you use a video streaming service such as Netflix. When you click on an item, it takes you to the details page.
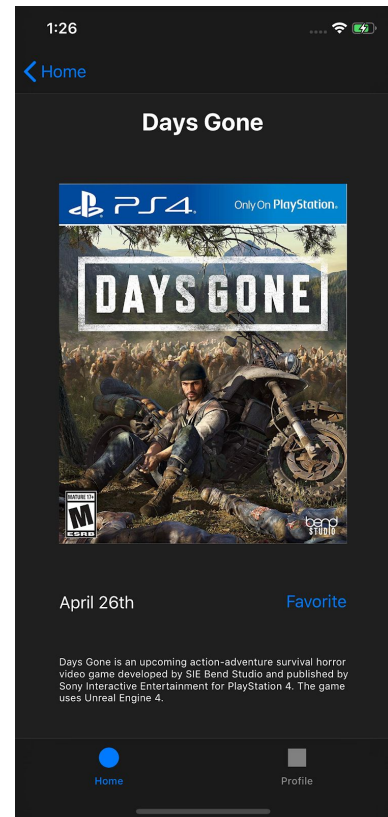

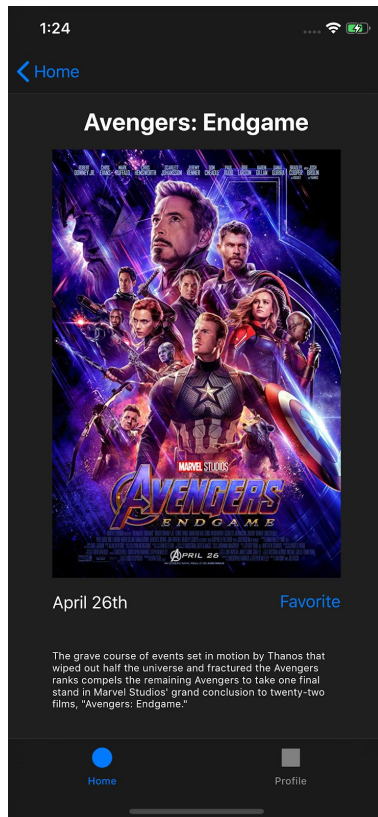

Details Page: When the item is clicked on from the home page, it takes you to the details page. On the details page, you are presented with mostly the same information, but we also added a description, favorite button, and for the TV shows we added which network you can access the show on. This page also shows you a better view of the poster artwork. At the top left you can see a navigation button that shows it will take you back to the home page.
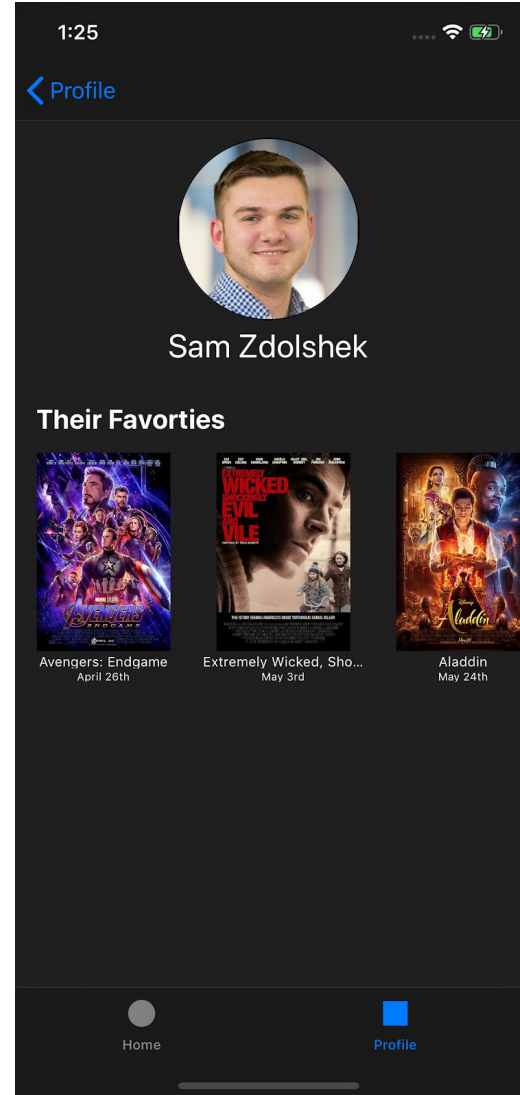

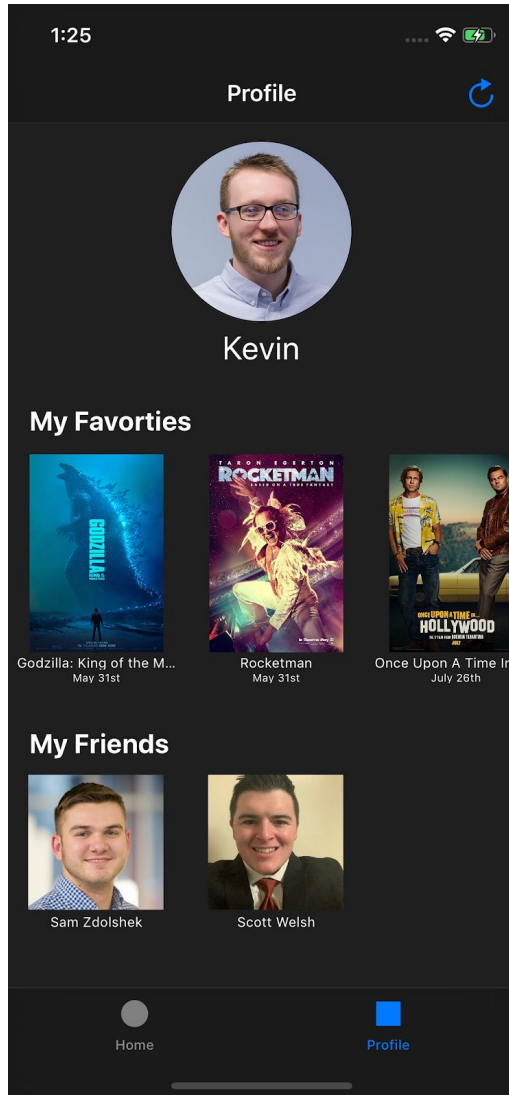

Profile and Friend Pages: When the tab bar is pressed at the bottom, you can select the profile tab. This tab button takes you to your own profile which has your profile image, username, your favorites, and your friends. My Favorites behaves exactly the same as the collection views on the home page, so when you click an item, a details page is shown. When you tap on a friends image it takes you to their profile where it shows you what they have added as a favorite. At the top right of your profile page there is a refresh button that reloads your favorites and adds in any item that was marked as a favorite on the details page.
